

# SALIVA TEST REPORT

**Patient Name**

Jane Doe

**PatientID**

JD700618

Non-smoker

**BMI** Unspecified **Waist** Unspecified**Medications**

None.

**DOB**

7/21/1965 (55 yrs)

**Report Date and Time**

4/7/2021 15:00

**Gender**

F

**Received Date and Time**

4/1/2021 15:00

**Menopausal Status**

Postmenopausal

**Specimen Collection Date and Time**

Saliva Morning 3/17/2021 06:20

**Provider ID: 0000**Doctor T  
17387 63rd Ave  
Lake Oswego, OR  
497035  
Ph: xxx-xxx-xxxx

## YOUR TEST RESULTS

Normal Range

Low or High Range

Your Levels

**Testosterone (pg/mL)****DHEA (pg/mL)****Cortisol Morning (ng/ml)**

# What do your hormone results mean?

## **TESTOSTERONE**

Testosterone has important role in maintaining bone strength, muscle mass and energy level. In women, testosterone contributes to sex drive or libido. Menopause causes significant decline in the testosterone levels. In men, testosterone is responsible for growth and development of sexual characteristics, facial and body hair, increased sexual drive and sperm production.

Low testosterone levels can result in conditions like hair loss, reduced muscle mass, hot flashes, depression and increased breast size. High testosterone levels have been linked with aggressive behavior, acne, low sperm count, liver disease and heart muscle damage.

## **DHEA**

DHEA is produced by the adrenal glands and is a precursor to both testosterone and estrogens. DHEA is also a neurohormone as small quantities are produced in the brain. It has a broad spectrum of benefits including improved energy, mood, memory, increased testosterone levels, enhanced libido and immune function. In men, low DHEA levels can cause low libido, reduced muscle mass and strength, depression, fatigue and compromised immune function. In women, DHEA is known to balance other hormones like estrogens, progesterone and testosterone. Low DHEA levels can cause weight gain, depression, fatigue and low libido.

## **CORTISOL**

In addition to being called as "the stress hormone", cortisol helps in proper glucose metabolism, converting sugars into energy. High cortisol levels in men have been associated with hyperglycemia, weight gain, compromised immune function and high blood pressure. Cortisol imbalance is known to result in conditions like irritability, fatigue, depression, foggy thinking, weight gain and bone loss. Stress reducing activities including meditation and breathing exercise have been recommended to relieve stress levels and avoid premature aging.

This report is only for information purpose and does not provide any diagnosis or treatment. There may be many other risk factors that must be considered for a complete assessment of your health. Please consult your healthcare provider to discuss your results and any questions you may have about your wellness. This test was developed and its performance characteristics determined by AYUMETRIX. It has not been cleared or approved by the FDA. The laboratory is regulated under CLIA as qualified to perform high-complexity testing.

# BLOOD TEST REPORT

<b>Patient Name</b> Jane Doe	<b>Patient ID</b> JD700618	<b>Non-smoker</b> <b>BMI</b> 22.7	<b>Waist</b> Unspecified
<b>DOB</b> 7/21/1965 (55 yrs)	<b>Report Date and Time</b> 4/7/2021 15:00	<b>Medications</b> None.	
<b>Gender</b> F	<b>Received Date and Time</b> 4/1/2021 15:00		
<b>Systolic blood pressure</b> Unspecified	<b>Specimen Collection Date and Time</b> Blood Spot 3/17/2021 6:20:00 AM		
	<b>Hours of Fasting</b> None	<b>Provider ID:</b> 0000	
	<b>Family History of</b>	Doctor T 17387 63rd Ave Lake Oswego, OR 497035 Ph: xxx-xxx-xxxx	
	Heart Disease No		
	Diabetes No		
	Cancer No		

## YOUR TEST RESULTS

█ Normal Range
 █ Borderline High
 █ Low or High Range
 █ Your Levels

### TSH (uIU/mL)

### hs-CRP (mg/L)

### 25- OH Vitamin D, Total (ng/ml)

# What do your test results mean?

## **THYROID-STIMULATING HORMONE (TSH)**

In primary hypothyroidism, thyroid-stimulating hormone (TSH) levels are elevated. In primary hyperthyroidism, TSH levels are low. The ability to quantitate circulating levels of TSH is important in evaluating thyroid function. It is especially useful in the differential diagnosis of primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low or normal.

Elevated or low TSH in the context of normal free thyroxine is often referred to as subclinical hypo- or hyperthyroidism, respectively.

## **HS-C-REACTIVE PROTEIN (HS-CRP)**

Blood measurements of hs-CRP are often performed to assess the risk of future heart disease. C-reactive protein (CRP) is produced by the liver and elevated CRP levels can be measured in blood in response to inflammation. High-sensitivity CRP (hs-CRP) is more precise than standard CRP while measuring baseline (i.e., normal) concentrations and enables a measure of chronic inflammation. Atherosclerosis is an inflammatory disease and hs-CRP is known as a biomarker of atherosclerotic cardiovascular disease risk.

**25-OH Vitamin D, Total:** Vitamin D is essential for bone strength as it helps in calcium absorption from diet. Traditionally, vitamin D deficiency has been known to cause rickets disease, but several studies have indicated that low vitamin D levels have also been associated with higher risk of cardiovascular disease, cognitive impairment in adults, asthma in children and cancer. Adequate levels of vitamin D could play a role in the prevention and treatment of several different conditions, including type 1 and type 2 diabetes, hypertension, glucose intolerance, and multiple sclerosis.

Inflammation is involved in many chronic diseases and there is a concern that vitamin D deficiency has a role in activating the inflammatory processes. Research has shown that vitamin D is needed for optimal immune performance and lowers inflammation.
